Introduction

The 2016 Human Development Report (HDR) focuses on how human development can be ensured for every one—now and in future. It starts with an account of the hopes and challenges of today’s world, envisioning where humanity wants to go. Our vision draws from and builds on the 2030 Agenda for Sustainable Development that the 193 member states of the United Nations endorsed in 2015—and the 17 Sustainable Development Goals (SDGs) the world has committed to achieve.

The Report explores who has been left behind in human development progress—and why. Human development progress over the past 25 years has been impressive on many fronts. But the gains have not been universal. There are imbalances across countries; socioeconomic, ethnic and racial groups; urban and rural areas; and women and men. Millions of people are unable to reach their full potential in life because they suffer deprivations in multiple dimensions of human development.

Besides mapping the nature and location of deprivations, the Report raises some specific analytical and assessment issues. To find out if everyone benefits from the human development progress, an average perspective is not going to work—a disaggregated approach is needed. Nor will a purely quantitative assessment succeed—qualitative aspects are needed, too. Data on agency freedom also need to be reviewed, particularly on voice and accountability. Finally, good generation and dissemination of data are important, requiring further in-depth research, experiments, consultations and alliance building among stakeholders.

The Report also identifies the national policies and key strategies to ensure that will enable every human being achieve at least basic human development and to sustain and protect the gains. And it addresses the structural challenges of global institutions and presents options for reform.

This briefing note is organized into nine sections. The first section presents information on the country coverage and methodology of the Statistical Annex of the 2016 HDR. The next eight sections provide information about key indicators of human development including the Human Development Index (HDI), the Inequality-adjusted Human Development Index (IHDI), the Gender Development Index (GDI), the Gender Inequality Index (GII), and the Multidimensional Poverty Index (MPI). The 2016 HDR introduces two experimental dashboards—on life-course gender gap and on sustainable development.

It is important to note that national and international data can differ because international agencies standardize national data to allow comparability across countries and in some cases may not have access to the most recent national data. We encourage national partners to explore the issues raised in the HDR with the most relevant and appropriate data from national and international sources.

Country coverage and the methodology of the Statistical Annex of the 2016 HDR

The Statistical Annex of the 2016 HDR presents the 2015 HDI (values and ranks) for 188 countries and UN-recognized territories, along with the IHDI for 151 countries, the GDI for 160 countries, the GII for 159 countries, and the MPI for 102 countries. Country rankings and values of the annual Human Development
The Human Development Index (HDI) is a summary measure for assessing progress in three basic dimensions of human development: a long and healthy life, access to knowledge and a decent standard of living. A long and healthy life is measured by life expectancy at birth. Knowledge level is measured by mean years of education among the adult population, which is the average number of years of education received in a life-time by people aged 25 years and older; and access to learning and knowledge by expected years of schooling for children of school-entry age, which is the total number of years of schooling a child of school-entry age can expect to receive if prevailing patterns of age-specific enrolment rates stay the same throughout the child’s life. The standard of living is measured by Gross National Income (GNI) per capita expressed in constant 2011 international dollars converted using purchasing power parity (PPP) conversion rates.

To ensure as much cross-country comparability as possible, the HDI is based primarily on international data from the United Nations Population Division (the life expectancy at birth data), the United Nations Educational, Scientific and Cultural Organization Institute for Statistics (the mean years of schooling and expected years of schooling data) and the World Bank (the GNI per capita data). As stated in the introduction, the HDI values and ranks in this year’s report are not comparable to those in past reports (including the 2015 HDR) because of a number of revisions to the component indicators. To allow for assessment of progress in HDIs, the 2016 report includes recalculated HDIs from 1990 to 2015 using consistent series of data. For more details see Technical note 1.

**Bahamas’ HDI value and rank**

Bahamas’ HDI value for 2015 is 0.792— which put the country in the high human development category—positioning it at 58 out of 188 countries and territories.

Between 2000 and 2015, Bahamas’ HDI value increased from 0.778 to 0.792, an increase of 1.8 percent. Table A reviews Bahamas’ progress in each of the HDI indicators. Between 1990 and 2015, Bahamas’ life expectancy at birth increased by 4.9 years, mean years of schooling remained constant and expected years of schooling increased by 0.6 years. Bahamas’ GNI per capita decreased by about 4.4 percent between 1990 and 2015.

Figure 1 below shows the contribution of each component index to Bahamas’ HDI since 2000.

**Figure 1: Trends in Bahamas’ HDI component indices 2000-2015**

Assessing progress relative to other countries

The human development progress, as measured by the HDI, can usefully be compared to other countries. For instance, during the period between 2000 and 2015 Bahamas, Argentina and Barbados experienced different degrees of progress toward increasing their HDIs (see figure 2).
Bahamas’ 2015 HDI of 0.792 is above the average of 0.746 for countries in the high human development group and above the average of 0.751 for countries in Latin America and the Caribbean. From Latin America and the Caribbean, countries which are close to Bahamas in 2015 HDI rank and to some extent in population size are Belize and Trinidad and Tobago, which have HDIs ranked 103 and 65 respectively (see table B).

**Inequality-adjusted HDI (IHDI)**

The HDI is an average measure of basic human development achievements in a country. Like all averages, the HDI masks inequality in the distribution of human development across the population at the country level. The 2010 HDR introduced the IHDI, which takes into account inequality in all three dimensions of the HDI by ‘discounting’ each dimension’s average value according to its level of inequality. The IHDI is basically the HDI discounted for inequalities. The ‘loss’ in human development due to inequality is given by the difference between the HDI and the IHDI, and can be expressed as a percentage. As the inequality in a country increases, the loss in human development also increases. We also present the coefficient of human inequality as a direct measure of inequality which is an unweighted average of inequalities in three dimensions. The IHDI is calculated for 151 countries. For more details see Technical note 2. Due to a lack of relevant data, the IHDI has not been calculated for this country.
Gender Development Index (GDI)

In the 2014 HDR, HDRO introduced a new measure, the GDI, based on the sex-disaggregated Human Development Index, defined as a ratio of the female to the male HDI. The GDI reflects gender inequalities in achievement in the same three dimensions of the HDI: health (measured by female and male life expectancy at birth), education (measured by female and male expected years of schooling for children and mean years for adults aged 25 years and older); and command over economic resources (measured by female and male estimated GNI per capita). For details on how the index is constructed refer to Technical note 3. Country groups are based on absolute deviation from gender parity in HDI. This means that the grouping takes into consideration inequality in favour of men or women equally. Due to a lack of relevant data, the GDI has not been calculated for this country.

Gender Inequality Index (GII)

The 2010 HDR introduced the GII, which reflects gender-based inequalities in three dimensions – reproductive health, empowerment, and economic activity. Reproductive health is measured by maternal mortality and adolescent birth rates; empowerment is measured by the share of parliamentary seats held by women and attainment in secondary and higher education by each gender; and economic activity is measured by the labour market participation rate for women and men. The GII can be interpreted as the loss in human development due to inequality between female and male achievements in the three GII dimensions. For more details on GII please see Technical note 4.

Bahamas has a GII value of 0.362, ranking it 77 out of 159 countries in the 2015 index. In Bahamas, 16.7 percent of parliamentary seats are held by women, and 87.4 percent of adult women have reached at least a secondary level of education compared to 87.6 percent of their male counterparts. For every 100,000 live births, 80 women die from pregnancy related causes; and the adolescent birth rate is 29.6 births per 1,000 women of ages 15-19. Female participation in the labour market is 69.4 percent compared to 79.1 for men.

In comparison, Belize and Trinidad and Tobago are ranked at 81 and 67 respectively on this index.

</tbody>
</table>

Maternal mortality ratio is expressed in number of deaths per 100,000 live births and adolescent birth rate is expressed in number of births per 1,000 women ages 15-19.

Multidimensional Poverty Index (MPI)

The 2010 HDR introduced the MPI, which identifies multiple overlapping deprivations suffered by households in 3 dimensions: education, health and living standards. The education and health dimensions are each based on two indicators, while standard of living is based on six indicators. All of the indicators needed to construct the MPI for a country are taken from the same household survey. The indicators are weighted to create a deprivation score, and the deprivation scores are computed for each household in the survey. A deprivation score of 33.3 percent (one-third of the weighted indicators) is used to distinguish
between the poor and nonpoor. If the household deprivation score is 33.3 percent or greater, the household (and everyone in it) is classified as multidimensionally poor. Households with a deprivation score greater than or equal to 20 percent but less than 33.3 percent live near multidimensional poverty. Finally, households with a deprivation score greater than or equal to 50 percent live in severe multidimensional poverty. The MPI is calculated for 102 developing countries in the 2015 HDR. Definitions of deprivations in each dimension, as well as methodology of the MPI are given in Technical note 5. Due to a lack of relevant data, the MPI has not been calculated for this country.

Dashboard on Life-course gender gap

Life-course gender gap dashboard contains a selection of 14 key indicators that display gender gaps over the life course – childhood and adolescence, adulthood and older age. The indicators refer to health, education, labour market and work, and social protection. Some indicators are presented only for women and some are given in the form of female-to-male ratio. Three-color coding is used to visualize partial grouping of countries by each indicator in this table. Countries are grouped partially by their performance in each indicator into three groups of approximately equal size (terciles), thus, there is the top third, the middle third and the bottom third. These three groups are colored. Sex ratio at birth is an exception - countries are grouped into two groups: the natural group with values between 1.04-1.07 (inclusive) and the gender-biased group if the value is outside the natural range. Countries with values of a female-to-male ratio concentrated around 1 form the group with the top performers in that indicator. Deviations from parity are treated equally irrespectively of which gender is overachieving. The coloring provides information about a country’s performance relative to others. It can be seen as a simple visualization tool as it helps the users to immediately picture the country’s performance. It also allows grouping countries by each indicator using a color scale. More details about partial grouping in this table are given in Technical note 6.

Table G provides the number of indicators in which Bahamas performs: better than at least two thirds of countries (i.e., it is among the top third performers), better than at least one third but worse than at least one third (i.e., it is among the medium third performers), and worse than at least two thirds of countries (i.e., it is among the bottom third performers). Figures for Belize and Trinidad and Tobago are also shown in the table for comparison.

Dashboard on Sustainable development

Sustainable development dashboard contains a selection of 15 key indicators that cover environmental, economic and social sustainable development. Environmental sustainability indicators represent a mix of level and change indicators related to renewable energy consumption, carbon-dioxide emissions, change in forest area and fresh water withdrawals. Forest area as percentage of the total land area is given in the
table but is not used for comparison, instead, the total change in forest area between 1990 and 2015 is used. Economic sustainability indicators look at adjusted net savings, external debt stock, natural resources depletion, diversity of economy and government’s spending on research and development. Social sustainability is captured by changes in income and gender inequality, multidimensional poverty and the projected old age dependency ratio. Three-color coding is used to visualize partial grouping of countries by each indicator in this table. Countries are grouped by each indicator into three groups of approximately equal sizes (terciles), thus there is the best third, the middle third and the bottom third. The intention is not to suggest the thresholds or target values for these indicators but to allow a crude assessment of country’s performance relative to others. More details about partial grouping in this table are given in Technical note 7.

Table H provides the number of indicators in which Bahamas performs: better than at least two thirds of countries (i.e., it is among the top third performers), better than at least one third but worse than at least one third (i.e., it is among the medium third performers), and worse than at least two thirds of countries (i.e., it is among the bottom third performers). Figures for Belize and Trinidad and Tobago are also shown in the table for comparison.
