

## **The Next Frontier: Human Development and the Anthropocene**

*Briefing note for countries on the 2020 Human Development Report*

### **Trinidad and Tobago**

#### **Introduction**

This year marks the 30th Anniversary of the first Human Development Report and of the introduction of the Human Development Index (HDI). The HDI was published to steer discussions about development progress away from GDP towards a measure that genuinely “counts” for people’s lives.

Introduced by the Human Development Report Office (HDRO) thirty years ago to provide a simple measure of human progress – built around people’s freedoms to live the lives they want to - the HDI has gained popularity with its simple yet comprehensive formula that assesses a population’s average longevity, education, and income. Over the years, however, there has been a growing interest in providing a more comprehensive set of measurements that capture other critical dimensions of human development.

To respond to this call, new measures of aspects of human development were introduced to complement the HDI and capture some of the “missing dimensions” of development such as poverty, inequality and gender gaps. Since 2010, HDRO has published the Inequality-adjusted HDI, which adjusts a nation’s HDI value for inequality within each of its components (life expectancy, education and income) and the Multidimensional Poverty Index that measures people’s deprivations directly. Similarly, HDRO’s efforts to measure gender inequalities began in the 1995 Human Development Report on gender, and recent reports have included two indices on gender, one accounting for differences between men and women in the HDI dimensions, the other a composite of inequalities in empowerment and well-being.

This briefing note is organized into six sections. The first section presents information on the country coverage and methodology for the 2020 Human Development Report. The next five sections provide information about key composite indices of human development: the HDI, the Inequality-adjusted Human Development Index (IHDI), the Gender Development Index (GDI), the Gender Inequality Index (GII), and the Multidimensional Poverty Index (MPI).

The tables presented in this note depict the state of human development before the COVID-19 pandemic based on available data for 2019 and earlier years. Data reflecting changes caused by the COVID-19 pandemic and its socioeconomic fallout in 2020 will be available in 2021 and will be presented in tables and related analyses of the 2021 Human Development Report.

It is important to note that national and international data can differ because international agencies standardize national data to allow comparability across countries and in some cases may not have access to the most recent national data.

## **1- Country coverage and the methodology of the 2020 Human Development Report**

The 2020 Human Development Report presents the 2019 HDI (values and ranks) for 189 countries and UN-recognized territories, along with the IHDI for 152 countries, the GDI for 167 countries, the GII for 162 countries, and the MPI for 107 countries.<sup>1</sup>

It is misleading to compare values and rankings with those of previously published reports, because of revisions and updates of the underlying data and adjustments to goalposts. Readers are advised to assess progress in HDI values by referring to Table 2 ('Human Development Index Trends') in the 2020 Human Development Report. Table 2 is based on consistent indicators, methodology and time-series data and, thus, shows real changes in values and ranks over time, reflecting the actual progress countries have made. Small changes in values should be interpreted with caution as they may not be statistically significant due to sampling variation. Generally speaking, changes at the level of the third decimal place in any of the composite indices are considered insignificant.

Unless otherwise specified in the source, tables use data available to HDRO as of 15 July 2020. All indices and indicators, along with technical notes on the calculation of composite indices, and additional source information are available online at <http://hdr.undp.org/en/data>

For further details on how each index is calculated please refer to [Technical Notes 1-6](#) and the associated background papers available on the Human Development Report website: <http://hdr.undp.org/en/data>

## **2- Human Development Index (HDI)**

The HDI is a summary measure for assessing long-term progress in three basic dimensions of human development: a long and healthy life, access to knowledge and a decent standard of living. A long and healthy life is measured by life expectancy. Knowledge level is measured by mean years of schooling among the adult population, which is the average number of years of schooling received in a life-time by people aged 25 years and older; and access to learning and knowledge by expected years of schooling for children of school-entry age, which is the total number of years of schooling a child of school-entry age can expect to receive if prevailing patterns of age-specific enrolment rates stay the same throughout the child's life. Standard of living is measured by Gross National Income (GNI) per capita expressed in constant 2017 international dollars converted using purchasing power parity (PPP) conversion rates. For more details see [Technical Note 1](#).

To ensure as much cross-country comparability as possible, the HDI is based primarily on international data from the United Nations Population Division (the life expectancy data), the United Nations Educational, Scientific and Cultural Organization Institute for Statistics (the mean years of schooling and expected years of schooling data) and the World Bank (the GNI per capita data). As stated in the introduction, the HDI values and ranks in this year's report are not comparable to those in past reports because of some revisions to the component indicators. To allow for assessment of progress in HDIs, the 2020 Human Development Report includes recalculated HDIs from 1990 to 2019 using consistent series of data.

### **2.1- Trinidad and Tobago's HDI value and rank**

Trinidad and Tobago's HDI value for 2019 is 0.796— which put the country in the high human development category—positioning it at 67 out of 189 countries and territories. The rank is shared with Seychelles.

Between 1990 and 2019, Trinidad and Tobago's HDI value increased from 0.668 to 0.796, an increase of 19.2 percent. Table A reviews Trinidad and Tobago's progress in each of the HDI indicators. Between 1990 and 2019, Trinidad and Tobago's life expectancy at birth increased by 5.4 years, mean years of schooling increased by 3.1 years and expected years of schooling increased by 1.8 years. Trinidad and Tobago's GNI per capita increased by about 151.1 percent between 1990 and 2019.

---

<sup>1</sup> Throughout this note, the term country refers to countries or UN-recognized territories.

**Table A: Trinidad and Tobago’s HDI trends based on consistent time series data and new goalposts**

	Life expectancy at birth	Expected years of schooling	Mean years of schooling	GNI per capita (2017 PPP\$)	HDI value
1990	68.1	11.2	7.9	10,445	0.668
1995	68.6	11.2	8.5	10,748	0.681
2000	69.4	11.9	9.2	15,565	0.717
2005	70.7	11.4	10.0	23,162	0.748
2010	71.9	12.7	10.8	27,344	0.784
2015	72.9	12.6	10.9	28,744	0.792
2016	73.1	12.8	11.0	26,678	0.792
2017	73.2	13.0	11.0	26,503	0.795
2018	73.4	13.0	11.0	26,328	0.795
2019	73.5	13.0	11.0	26,231	0.796

Figure 1 below shows the contribution of each component index to Trinidad and Tobago’s HDI since 1990.

**Figure 1: Trends in Trinidad and Tobago’s HDI component indices 1990-2019**

## 2.2- Assessing progress relative to other countries

Human development progress, as measured by the HDI, is useful for comparison between two or more countries. For instance, during the period between 1990 and 2019 Trinidad and Tobago, Costa Rica and Panama experienced different degrees of progress toward increasing their HDIs (see Figure 2).

**Figure 2: HDI trends for Trinidad and Tobago, Costa Rica and Panama, 1990-2019**

Trinidad and Tobago's 2019 HDI of 0.796 is above the average of 0.753 for countries in the high human development group and above the average of 0.766 for countries in Latin America and the Caribbean. From Latin America and the Caribbean, Trinidad and Tobago is compared with Bahamas and Jamaica, which have HDIs ranked 58 and 101, respectively (see Table B).

**Table B: Trinidad and Tobago's HDI and component indicators for 2019 relative to selected countries and groups**

	HDI value	HDI rank	Life expectancy at birth	Expected years of schooling	Mean years of schooling	GNI per capita (2017 PPP US\$)
<b>Trinidad and Tobago</b>	0.796	67	73.5	13.0	11.0	26,231
<b>Bahamas</b>	0.814	58	73.9	12.9	11.4	33,747
<b>Jamaica</b>	0.734	101	74.5	13.1	9.7	9,319
<b>Latin America and the Caribbean</b>	0.766	—	75.6	14.6	8.7	14,812
<b>High HDI</b>	0.753	—	75.3	14.0	8.4	14,255

### 3- Inequality-adjusted HDI (IHDI)

The HDI is an average measure of basic human development achievements in a country. Like all averages, the HDI masks inequality in the distribution of human development across the population at the country level. The 2010 Human Development Report introduced the IHDI, which takes into account inequality in all three dimensions of the HDI by 'discounting' each dimension's average value according to its level of inequality. The IHDI is basically the HDI discounted for inequalities. The 'loss' in human development due to inequality is given by the difference between the HDI and the IHDI, and can be expressed as a percentage. As the inequality in a country increases, the loss in human development also increases. We also present the coefficient of human inequality as a direct measure of inequality which is an unweighted average of inequalities in three dimensions. The IHDI is calculated for 152 countries. For more details see [Technical Note 2](#). Due to a lack of relevant data, the IHDI has not been calculated for this country.

#### 4- Gender Development Index (GDI)

In the 2014 Human Development Report, HDRO introduced a new measure, the GDI, based on the sex-disaggregated Human Development Index, defined as a ratio of the female to the male HDI. The GDI measures gender inequalities in achievement in three basic dimensions of human development: health (measured by female and male life expectancy at birth), education (measured by female and male expected years of schooling for children and mean years for adults aged 25 years and older) and command over economic resources (measured by female and male estimated GNI per capita). For details on how the index is constructed refer to [Technical Note 3](#). Country groups are based on absolute deviation from gender parity in HDI. This means that the grouping takes into consideration inequality in favour of men or women equally.

The GDI is calculated for 167 countries. The 2019 female HDI value for Trinidad and Tobago is 0.796 in contrast with 0.793 for males, resulting in a GDI value of 1.003, placing it into Group 1.<sup>2</sup> In comparison, the GDI value for Jamaica is 0.994 (see Table D).

**Table D: Trinidad and Tobago's GDI for 2019 relative to selected countries and groups**

	F-M ratio	HDI values		Life expectancy at birth		Expected years of schooling		Mean years of schooling		GNI per capita	
	GDI value	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male
<b>Trinidad and Tobago</b>	1.003	0.796	0.793	76.2	70.9	14.0	12.0	11.1	10.9	20,482	32,121
<b>Jamaica</b>	0.994	0.730	0.735	76.1	72.9	13.9	12.4	10.2	9.3	7,501	11,163
<b>Latin America and the Caribbean</b>	0.978	0.755	0.772	78.7	72.4	15.0	14.3	8.7	8.7	10,708	19,046
<b>High HDI</b>	0.961	0.736	0.766	78.0	72.8	14.1	13.9	8.2	8.7	10,529	17,912

#### 5- Gender Inequality Index (GII)

The 2010 Human Development Report introduced the GII, which reflects gender-based inequalities in three dimensions – reproductive health, empowerment, and economic activity. Reproductive health is measured by maternal mortality and adolescent birth rates; empowerment is measured by the share of parliamentary seats held by women and attainment in secondary and higher education by each gender; and economic activity is measured by the labour market participation rate for women and men. The GII can be interpreted as the loss in human development due to inequality between female and male achievements in the three GII dimensions. For more details on GII please see [Technical Note 4](#).

Trinidad and Tobago has a GII value of 0.323, ranking it 73 out of 162 countries in the 2019 index. In Trinidad and Tobago, 32.9 percent of parliamentary seats are held by women, and 74.5 percent of adult women have reached at least a secondary level of education compared to 71.2 percent of their male counterparts. For every 100,000 live births, 67.0 women die from pregnancy related causes; and the adolescent birth rate is 30.1 births per 1,000 women of ages 15-19. Female participation in the labour market is 50.1 percent compared to 70.2 for men (see Table E).

In comparison, Bahamas and Jamaica are ranked at 77 and 88, respectively, on this index.

<sup>2</sup> Countries are divided into five groups by absolute deviation from gender parity in HDI values. Group 1 comprises countries with high equality in HDI achievements between women and men (absolute deviation of less than 2.5 percent), group 2 comprises countries with medium to high equality in HDI achievements between women and men (absolute deviation of 2.5–5 percent), group 3 comprises countries with medium equality in HDI achievements between women and men (absolute deviation of 5–7.5 percent), group 4 comprises countries with medium to low equality in HDI achievements between women and men (absolute deviation of 7.5–10 percent) and group 5 comprises countries with low equality in HDI achievements between women and men (absolute deviation from gender parity of more than 10 percent).

**Table E: Trinidad and Tobago's GII for 2019 relative to selected countries and groups**

	GII value	GII Rank	Maternal mortality ratio	Adolescent birth rate	Female seats in parliament (%)	Population with at least some secondary education (%)		Labour force participation rate (%)	
						Female	Male	Female	Male
<b>Trinidad and Tobago</b>	0.323	73	67.0	30.1	32.9	74.5	71.2	50.1	70.2
<b>Bahamas</b>	0.341	77	70.0	30.0	21.8	88.0	91.0	68.1	81.6
<b>Jamaica</b>	0.396	88	80.0	52.8	19.0	70.0	62.4	59.8	72.5
<b>Latin America and the Caribbean</b>	0.389	—	72.7	63.2	31.4	60.4	59.7	52.1	76.9
<b>High HDI</b>	0.340	—	62.3	33.6	24.5	69.8	75.1	54.2	75.4

Maternal mortality ratio is expressed in number of deaths per 100,000 live births and adolescent birth rate is expressed in number of births per 1,000 women ages 15-19.

## **6- Multidimensional Poverty Index (MPI)**

The 2010 Human Development Report introduced the MPI, which identifies multiple overlapping deprivations suffered by individuals in 3 dimensions: health, education and standard of living. The health and education dimensions are based on two indicators each, while standard of living is based on six indicators. All the indicators needed to construct the MPI for a country are taken from the same household survey. The indicators are weighted to create a deprivation score, and the deprivation scores are computed for each individual in the survey. A deprivation score of 33.3 percent (one-third of the weighted indicators) is used to distinguish between the poor and nonpoor. If the deprivation score is 33.3 percent or greater, the household (and everyone in it) is classified as multidimensionally poor. Individuals with a deprivation score greater than or equal to 20 percent but less than 33.3 percent are classified as vulnerable to multidimensional poverty. Finally, individuals with a deprivation score greater than or equal to 50 percent live in severe multidimensional poverty.

Since 2018, HDRO and the Oxford Poverty and Human Development Initiative jointly produce and publish the MPI estimates. The latest release from July 2020 covers 107 developing countries (countries that lack survey data that allow for the calculation of the MPI are not included): '[Charting pathways out of multidimensional poverty: Achieving the SDGs](#)' (also available in [French](#) and [Spanish](#)). Definitions of deprivations in each indicator, as well as methodology of the MPI are given in [Technical note 5](#). Continuing with the practice from the previous years, HDRO is making public the statistical programs used in the calculation of the 2020 MPI for a large selection of countries (see <http://hdr.undp.org/en/content/multi-dimensional-poverty>).

The most recent survey data that were publicly available for Trinidad and Tobago's MPI estimation refer to 2011. In Trinidad and Tobago, 0.6 percent of the population (9 thousand people) are multidimensionally poor while an additional 3.7 percent are classified as vulnerable to multidimensional poverty (51 thousand people). The breadth of deprivation (intensity) in Trinidad and Tobago, which is the average deprivation score experienced by people in multidimensional poverty, is 38.0 percent. The MPI, which is the share of the population that is multidimensionally poor, adjusted by the intensity of the deprivations, is 0.002. Jamaica has an MPI value of 0.018.

Table F shows the percentage of Trinidad and Tobago's population that lives in severe multidimensional poverty. The contributions of deprivations in each dimension to overall poverty complete a comprehensive picture of people living in multidimensional poverty in Trinidad and Tobago. Figures for Jamaica are also shown in the table for comparison.

**Table F: The most recent MPI for Trinidad and Tobago relative to selected countries**

	Survey year	MPI value	Headcount (%)	Intensity of deprivations (%)	Population share (%)			Contribution to overall poverty of deprivations in (%)		
					Vulnerable to multidimensional poverty	In severe multidimensional poverty	Below income poverty line	Health	Education	Standard of living
<b>Trinidad and Tobago</b>	2011	0.002	0.6	38.0	3.7	0.1	..	45.5	34.0	20.5
<b>Jamaica</b>	2014	0.018	4.7	38.7	6.4	0.8	..	42.1	17.5	40.4
<b>Latin America and the Caribbean</b>	-	0.031	7.2	43.0	7.4	1.9	4.2	35.9	26.2	37.9
